To the Chairperson
David Sheppard With Respect.

Trans power Board of inquiry.

Dear Sir, firstly I must thank you for corresponding with me with regards to up dating progress with your project.

I have from a individual point of view no doubts that this construction holds a very important mild stone in the power generation process requirements needed for new zealands future.

The importance of having transmission utilities that function efficiently being able to carry very high volumes of current to desiccated parts of the country, this has to open up new potential for future development in industry and domestic use for major contributors to our economy..

This country I see has highly trained skilled people in this type of technology power development second to none in the world ever growing demand for electricity.

In today's unstable economical environment I now you must take charge to push for this asset in not holding back but to now pursue this project with stealth.

One thing we must always remember to note is our publics view point on constructive criticism pointing to air out gray areas on focusing concerns on the environmental impact i.e., displacement of natural wild life and interfloura, ie, must have priority in the equation as well, and not only to mention facts that relate in alignment with the sobering importance that all major projects do not affect the performance of other major business in value.

No doubt with respect sir you would have been challenged on these issues and in regards you would have responded accordingly.

With regards sir to the process of decision making balancing all the pros and cons in view of I can imagine countless hours of research gone into preparing your final draft sheet, geographical mapping resource consents, this on going hand in hand etc.

As with the area I live around is the whakamaru south Waikato region where I live and in comment have seen hydro development in my time and now geothermal drilling under way for potential geothermal power development in the near future, we as a country have this great potential .

I am or have a great interest in wind power hydro solo and geothermal power generation potential, schemes as such because of its low polluting factors and renewable sustainable resource ability as such.

Well I must leave you on that note Mr Chairman and thank the transpower board and you for giving me the opportunity to express my point of view and in regards your company has done the right democratic thing in line of this process by openly discussing this project with the new Zealand public.

Please keep in touch Mr Chairman David Sheppard

I wish all of your staff the very best during the construction process, work safe.

yours sincerely
William Phillips.
