## Objectives for the contribution

Do you agree with these objectives for our contribution? No

1b. What is most important to you?

This appears to take for granted that people can affect the level of emissions to a big enough degree to affect the climate. This is of course rubbish when you take into account the emissions that occur naturally such as from volcanoes. These natural emissions far exceed the entire emissions from humans though out the world and there is no way we can reduce these, The entire Global Warming argument is based on so called data that has no relationship to what is happening in the world and is being pushed as it has spawned a huge financial industry which lives on the false arguments that the industry generates.

What would be a fair contribution for New Zealand?

2. What do you think the nature of New Zealand's emissions and economy means for the level of target that we set?

How will our contribution affect New Zealanders?

3. What level of cost is appropriate for New Zealand to reduce it's greenhouse gas emissions? For example, what would be a reasonable reduction in annual household consumption?

4. Of the opportunities for New Zealand to reduce its emissions (as outlined on page 15 of the discussion document), which do you think are the most likely to occur, or be most important for New Zealand?

## Summary

5. How should New Zealand take into account the future uncertainties of technologies and costs when setting its target?

## Other comments

6. Is there any further information you wish the Government to consider? Please explain.
