Objectives for the contribution

Do you agree with these objectives for our contribution? No

1b. What is most important to you?

What would be a fair contribution for New Zealand?

2. What do you think the nature of New Zealand's emissions and economy means for the level of target that we set?

How will our contribution affect New Zealanders?

3. What level of cost is appropriate for New Zealand to reduce its greenhouse gas emissions? For example, what would be a reasonable reduction in annual household consumption?
Alternative Energy Sources such as Wind, Solar and Bio-fuels are expensive and unreliable and will result in higher energy prices and a lower standard of living

4. Of the opportunities for New Zealand to reduce its emissions (as outlined on page 15 of the discussion document), which do you think are the most likely to occur, or be most important for New Zealand?

Summary

5. How should New Zealand take into account the future uncertainties of technologies and costs when setting its target? Do as little as possible

Other comments

6. Is there any further information you wish the Government to consider? Please explain.
The Computer Model predictions of warming caused by increased CO2 have proved wrong as there has been no significant warming over the last 18 years.
Empirical measurement indicates that the CO2 contribution to warming is relatively minor.
I speak as some-one knowledgeable in this area with a 1st Honours Degree in Physics and work as a Software Engineer with experience in Computer predictions of natural systems
